

How to set up a proxy server in Android

With Android, you must configure proxy settings for each network you use. In addition, the proxy will only be used by your web browser. Other internet applications may choose to use or ignore the proxy based on their own internal settings. This is another reason why VPNs tend to be better choices — when you use one, it covers all the internet traffic from your device.

1. Open Android's Settings and tap **Wi-Fi** to view a list of Wi-Fi networks.
2. Long-press the Wi-Fi network name for which you want to change the proxy settings. Tap **Modify Network**.
3. Tap **Advanced Options**.

4. Tap **Manual** to change your proxy's settings. Enter your hostname and proxy port.

OR

If you have a Proxy Auto-Config (PAC) file, select **Proxy Auto-Config** and Android will prompt you to enter the PAC address.

5. Tap **SAVE**.
