

How to set up a proxy server on a Mac running macOS

Here's how to set up a proxy server on a Mac running macOS 10.15 Catalina. Other macOS versions use essentially the same commands.

1. Open System Preferences. One way to get there is to click on the **Apple menu > System Preferences**.
2. Choose the **Network icon** to adjust connectivity settings.
3. Select the type of network you use, which is usually Ethernet or Wi-Fi.
4. Click **Advanced > Proxies**.

5. To automatically configure your proxy server settings, select **Auto Proxy Discovery**. Click on **Secure Web Proxy (HTTPS)**. Type in the proxy server address and its port number in the fields on the right.
