

How to set up a proxy server in Windows

Here's how to set up your Windows PC to use a proxy server on Windows 8 or Windows 10:

1. Press the **Windows** + **I** keys simultaneously to access the Windows Settings menu.
2. On Windows 10, click **Settings** > **Network & Internet** > **Proxy**. On Windows 8, click **Settings** > **Network Proxy**.
3. Under the Manual Setup section, set the “Use a Proxy Server” toggle to **On**. Make sure the “Automatically detect settings” toggle is also on.
4. By default, Windows automatically checks to see if your business, school, or local network already has an automatic proxy server setup ready to run for you. If it does, Windows tells you its name, and encourages you to follow its instructions.
5. Assuming that Windows finds a PAC file, in the Automatic Proxy Setup, set the **Use Setup**

Script switch to **On**.

6. Enter the script address and click **Save**.
